Abstract. Minimal keys and antikeys play a very important role in the theory of the design of relational databases. The minimal key and antikey results have been widely investigated. Hypergraphs theory [2] is an important subfield of discrete mathematics with many relevant applications in both theoretical and applied computer science. A set of minimal keys and a set of antikeys form simple hypergraphs. In this paper, we are to investigate the minimal keys of relation schemes. We characterize the set of all minimal keys of relation schemes in terms of hypergraphs. The set of antikeys is also studied in this paper.

1. INTRODUCTION

In this section we briefly present the main concepts of the theory of relational databases which will be needed in sequel. The concepts and facts given in this section can be found in [1,3÷5].

Let $U$ be a nonempty finite set of attributes (e.g. name, age etc) and $R = \{h_1, \ldots, h_m\}$ be a relation over $U$. A functional dependency (FD for short) over $U$ is a statement of form $X \rightarrow Y$, where $X, Y \subseteq U$. The FD $X \rightarrow Y$ holds in a relation $R$ if

$$(\forall h_i, h_j \in R)((\forall a \in X)(h_i(a) = h_j(a))) \Rightarrow (\forall b \in Y)(h_i(b) = h_j(b)).$$

We also say that $R$ satisfies the FD $X \rightarrow Y$.

Let $F_R$ be a family of all FDs that holds in $R$. Then $F = F_R$ satisfies

(F1) $X \rightarrow X \in F$,
(F2) $(X \rightarrow Y \in F, Y \rightarrow Z \in F) \Rightarrow (X \rightarrow Z \in F)$,
(F3) $(X \rightarrow Y \in F, X \subseteq V, W \subseteq Y) \Rightarrow (V \rightarrow W \in F)$,
(F4) $(X \rightarrow Y \in F, V \rightarrow W \in F) \Rightarrow (X \cup V \rightarrow Y \cup W \in F)$.

A family of FDs satisfying (F1) - (F4) is called an $f$ - family over $U$. 
Clearly, $F_R$ is an $f$-family over $U$. It is known [1] that if $F$ is an arbitrary $f$-family, then there is a relation $R$ over $U$ such that $F_R = F$.

Give a family $F$ of FDs over $U$, there exists a unique minimal $f$-family $F^+$ that contains $F$. It can be seen that $F^+$ contains all FDs which can be derived from $F$ by the rules (F1) - (F4).

A relation scheme $s$ is a pair $(U, F)$, where $U$ is a nonempty finite set of attributes and $F$ is a set of FDs over $U$. $X^+$ is called the closure of $X$ on $s$. It is obvious that $X \rightarrow Y \in F^+$ if and only if $Y \subseteq X^+$.

Let $s = (U, F)$ be a relation scheme and $K \subseteq U$. Then $K$ is a key of $s$ if $K \rightarrow U \in F^+$. $K$ is a minimal key of $s$ if $K$ is a key of $s$ and any proper subset of $K$ is not a key of $s$.

Denote $\mathcal{K}_a$ the set of all minimal keys of $s$. Evidently, $\mathcal{K}_a$ is a Sperner system over $U$ (i.e. for every $A, B \in \mathcal{K}_a$ implies $A \not\subseteq B$).

Let $\mathcal{K}$ be a Sperner system over $U$. We define the set of antikeys of $\mathcal{K}$, denoted by $\mathcal{K}^{-1}$, as follows:

$$\mathcal{K}^{-1} = \{ A \in \mathcal{P}(U) \mid (B \in \mathcal{K}) \Rightarrow (B \not\subseteq A) \text{ and } (A \subset C) \Rightarrow (\exists B \in \mathcal{K})(B \subseteq C) \}.$$ 

It is easy to see that $\mathcal{K}^{-1}$ is also a Sperner system over $U$.

2. HYPERGRAPHS AND TRANSVERSALS

Let $U$ be a nonempty finite set and put $\mathcal{P}(U)$ for the family of all subsets of $U$. The family $\mathcal{H} = \{ E_i \mid E_i \in \mathcal{P}(U), i = 1, 2, \ldots, m \}$ is called a hypergraph over $U$ if $E_i \neq \emptyset$ holds for all $i$ (in [2] it is required that the union of $E_i$s is $U$, in this paper we do not require this).

The elements of $U$ are called vertices, and the sets $E_1, \ldots, E_m$ the edges of the hypergraph $\mathcal{H}$.

A hypergraph $\mathcal{H}$ is called simple if it satisfies

$$\forall E_i, E_j \in \mathcal{H} : E_i \subseteq E_j \Rightarrow E_i = E_j.$$ 

It can be seen that simple hypergraphs are Sperner systems. Clearly, $\mathcal{K}_a$ and $\mathcal{K}_a^{-1}$ are simple hypergraphs.

Let $\mathcal{H}$ be a hypergraph over $U$. Then $\min(\mathcal{H})$ denotes the set of minimal edges of $\mathcal{H}$ with respect to set inclusion, i.e.,

$$\min(\mathcal{H}) = \{ E_i \in \mathcal{H} \mid \forall E_j \in \mathcal{H} : E_j \subset E_i \};$$

and $\max(\mathcal{H})$ denotes the set of maximal edges of $\mathcal{H}$ with respect to set inclusion, i.e.,

$$\max(\mathcal{H}) = \{ E_i \in \mathcal{H} \mid \exists E_j \in \mathcal{H} : E_j \supset E_i \}.$$ 

It is clear that, $\min(\mathcal{H})$ and $\max(\mathcal{H})$ are simple hypergraphs. Furthermore, $\min(\mathcal{H})$ and $\max(\mathcal{H})$ are uniquely determined by $\mathcal{H}$.

A set $T \subseteq U$ is called a transversal of $\mathcal{H}$ (sometimes it is called hitting set) if it meets all edges of $\mathcal{H}$, i.e.,

$$\forall E \in \mathcal{H} : T \cap E \neq \emptyset.$$ 

Denote by $\mathcal{Trs}(\mathcal{H})$ the family of all transversals of $\mathcal{H}$. A transversal $T$ of $\mathcal{H}$ is called minimal if no proper subset $T'$ of $T$ is a transversal.
The family of all minimal transversals of \( \mathcal{H} \) is called the transversal hypergraph of \( \mathcal{H} \), and denoted by \( Tr(\mathcal{H}) \). Clearly, \( Tr(\mathcal{H}) \) is a simple hypergraph.

**Proposition 2.1.** ([2]) Let \( \mathcal{H} \) and \( \mathcal{G} \) two simple hypergraphs over \( U \). Then \( \mathcal{H} = Tr(\mathcal{G}) \) if and only if \( \mathcal{G} = Tr(\mathcal{H}) \).

**Proposition 2.2.** ([5]) Let \( \mathcal{H} \) be a hypergraph over \( U \). Then
\[
Tr(\mathcal{H}) = Tr(\text{min}(\mathcal{H})).
\]

The following algorithm finds the family of all minimal transversals of a given hypergraph (by induction).

**Algorithm 2.3.** ([3])

Input: let \( \mathcal{H} = \{E_1, \ldots, E_m\} \) be a hypergraph over \( U \).

Output: \( Tr(\mathcal{H}) \).

Method:

*Step 0.* We set \( L_1 := \{\{a\} \mid a \in E_1\} \). It is obvious that \( L_1 = Tr(\{E_1\}) \).

*Step q+1.* (\( q < m \)) Assume that
\[
L_q = S_q \cup \{B_1, \ldots, B_{t_q}\},
\]
where \( B_i \cap E_{q+1} = \emptyset \), \( i = 1, \ldots, t_q \) and \( S_q = \{A \in L_q \mid A \cap E_{q+1} \neq \emptyset\} \).

For each \( i \) (\( i = 1, \ldots, t_q \)) constructs the set \( \{B_i \cup \{b\} \mid b \in E_{q+1}\} \). Denote them by \( A^i_1, \ldots, A^i_{r_i}(i = 1, \ldots, t_q) \). Let
\[
L_{q+1} = S_q \cup \{A^i_p \mid A \in S_q \Rightarrow A \notin A^i_p, 1 \leq i \leq t_q, 1 \leq p \leq r_i\}.
\]

**Theorem 2.4.** ([3]) For every \( q \) (\( 1 \leq q \leq m \)) \( \mathcal{L}_q = Tr(\{E_1, \ldots, E_q\}) \), i.e., \( \mathcal{L}_m = Tr(\mathcal{H}) \).

It can be seen that the determination of \( Tr(\mathcal{H}) \) based on our algorithm does not depend on the order of \( E_1, \ldots, E_m \).

**Remark 2.5.** ([3]) Denote \( L_q = S_q \cup \{B_1, \ldots, B_{t_q}\} \), and \( l_q \) (\( 1 \leq q \leq m - 1 \)) be the number of elements of \( L_q \). It can be seen that the worst-case time complexity of our algorithm is
\[
O(|U|^2 \cdot \sum_{q=0}^{m-1} l_qu_q),
\]
where \( l_0 = l_0 = 1 \) and
\[
u_q = \begin{cases} 
   l_q - l_q; & \text{if } l_q > l_q, \\
   1; & \text{if } l_q = l_q.
\end{cases}
\]

Clearly, in each step of our algorithm \( L_q \) is a simple hypergraph. It is known that the size of arbitrary simple hypergraph over \( U \) cannot be greater than \( C_{n/2}^{[n/2]} \), where \( n = |U| \). \( C_{n/2}^{[n/2]} \) is asymptotically equal to \( 2^{n+1/2}/(\pi n)^{1/2} \). From this, the worst-case time complexity of our algorithm cannot be more than exponential in the number of attributes. In cases for which \( l_q \leq l_q \) (\( q = 1, \ldots, m - 1 \)), it is easy to see that the time complexity of our algorithm is not greater than \( O(|U|^2 \cdot |\mathcal{H}| \cdot |Tr(\mathcal{H})|^2) \). Thus, in these cases this algorithm finds \( Tr(\mathcal{H}) \) in polynomial time in \( |U|, |\mathcal{H}| \) and \( |Tr(\mathcal{H})| \). Obviously, if the number of elements of \( \mathcal{H} \) is small, then this algorithm is very effective. It only requires polynomial time in \( |U| \).

The following proposition is obvious.
Proposition 2.6. (3)] The time complexity of finding $\text{Tr}(\mathcal{H})$ of a given hypergraph $\mathcal{H}$ is (in general) exponential in the number of elements of $U$.

Proposition 2.6 is still true for a simple hypergraph.

3. MINIMAL KEYS

In this section, we investigate the minimal keys of relation schemes. We give some descriptions of the set of all minimal keys of relation schemes in terms of hypergraphs.

Let $s = (U, F)$ be a relation scheme. We set $\mathcal{L}_s = \{X^+ | X \subseteq U\}$, i.e., $\mathcal{L}_s$ is the set of all closures of $s$. We define the family $\mathcal{M}_s$ as follows

$$\mathcal{M}_s = \mathcal{L}_s - \{U\}.$$ 

Then $\overline{\mathcal{M}}_s = \{U - A | A \in \mathcal{M}_s\}$ is called the complemented family of $\mathcal{M}_s$.

Lemma 3.1. Let $s = (U, F)$ be a relation scheme. Then, if $A \in \overline{\mathcal{M}}_s$ then $U - A$ is not the key of $s$.

Proof. Assume that $A \in \overline{\mathcal{M}}_s$. Thus, $U - A \in \mathcal{M}_s$. By the definition of $\mathcal{M}_s$, we have

$$(U - A)^+ = U - A$$

and

$$U - A \neq U.$$

Consequently, $U - A$ is not a key of $s$.

The lemma is proved.

Lemma 3.2. Let $s = (U, F)$ be a relation scheme. Then, $A \in \text{Trs}(\mathcal{K}_s)$ if and only if $U - A$ is not the key of $s$.

Proof. Suppose that $U - A$ is a key of $s$. From this and the hypothesis $A \in \text{Trs}(\mathcal{K}_s)$, we have

$$A \cap (U - A) \neq \emptyset.$$ 

This is a conflict.

Conversely, assume that $A \notin \text{Trs}(\mathcal{K}_s)$. If there exists $K \in \mathcal{K}_s$ such that $A \cap K = \emptyset$ then $U - A$ is a key of $s$, which contradicts the hypothesis $U - A$ is not the key of $s$.

The lemma is proved.

Theorem 3.3. Let $s = (U, F)$ be a relation scheme. Then

$$\text{Tr}(\mathcal{K}_s) = \min(\overline{\mathcal{M}}_s).$$

Proof. Suppose that $A \in \text{Tr}(\mathcal{K}_s)$. By Lemma 3.2 we obtain which $U - A$ is not a key of $s$. Clearly, $A \neq \emptyset$ and $(U - A)^+ \neq A$. On the other hand, we have also

$$U - (U - A)^+ \cap K \neq \emptyset \quad \forall K \in \mathcal{K}_s.$$ 

Hence, if

$$U - A \subseteq (U - A)^+$$

then

$$A \supset U - (U - A)^+.$$
This contradicts with the hypothesis $A \in \text{Tr}(\mathcal{K}_s)$. Consequently, $(U - A)^+ = U - A$, i.e., $U - A \in \mathcal{M}_s$. Thus, $A \in \overline{\mathcal{M}_s}$.

Now we assume that there exists a $B \subset A$ and $B \neq \emptyset$ such that $B \in \overline{\mathcal{M}_s}$. Then, according to Lemma 3.1 we have $U - B$ is not a key of $s$. By Lemma 3.2 we obtain $B \in Trs(\mathcal{K}_s)$, which contradicts the fact that $A \in \text{Tr}(\mathcal{K}_s)$. Therefore, $A \in \text{min}(\overline{\mathcal{M}_s})$ holds.

Conversely, assume that $A \in \text{min}(\overline{\mathcal{M}_s})$. Hence, $A \in \overline{\mathcal{M}_s}$. By Lemma 3.1 we have $U - A$ is not a key of $s$. Thus, according to Lemma 3.2 we obtain $A \in \text{Trs}(\mathcal{K}_s)$. Suppose that there is a $B \subset A$ such that $B \in \text{Tr}(\mathcal{K}_s)$. By the above proof we obtain $B \in \overline{\mathcal{M}_s}$. This contradicts with the fact that $A \in \text{min}(\overline{\mathcal{M}_s})$. Hence, $A \in \text{Tr}(\mathcal{K}_s)$ holds.

The theorem is proved.

By Proposition 2.1 and Theorem 3.3, the following corollary is immediate.

**Corollary 3.4.** Let $s = (U, F)$ be a relation scheme. Then

$$\mathcal{K}_s = \text{Tr}(\text{min}(\overline{\mathcal{M}_s})).$$

**Theorem 3.5.** Let $s = (U, F)$ be a relation scheme. Then

$$\mathcal{K}_s = \text{Tr}(\text{min}(\overline{\mathcal{M}_s} - \{\emptyset\})).$$

**Proof.** It is clear that from the definiton of $\mathcal{M}_s$ and Corollary 3.4.

The theorem is proved.

### 4. ANTIKEYS

In this section, we study the set of antkeys by hypergraphs. We present connections between the set of antkeys and the set of closures of relation schemes.

Let $\mathcal{A}$ be a family of subsets of $U$. We define

$$\text{min}(\mathcal{A}) = \{A_i \in \mathcal{A} \mid \exists A_j : A_j \subset A_i\}$$

and

$$\text{max}(\mathcal{A}) = \{A_i \in \mathcal{A} \mid \exists A_j : A_j \supset A_i\}.$$

**Lemma 4.1.** Let $\mathcal{A}$ be a family of subsets of $U$. Then

$$\text{min}(\overline{\mathcal{A}}) = \text{max}(\mathcal{A}).$$

**Proof.** We shall prove that $\text{min}(\overline{\mathcal{A}}) = \text{max}(\mathcal{A})$. Suppose $A \in \text{min}(\overline{\mathcal{A}})$. Hence, $\overline{A} \in \text{min}(\overline{\mathcal{A}})$. This means that

$$\forall B \in \overline{A} : B \not\subset \overline{A}$$

or

$$\forall \overline{B} \in A : \overline{B} \not\supset A.$$

Thus, we obtain $A \in \text{max}(\mathcal{A})$.

On the other hand, let $A \in \text{max}(\mathcal{A})$. By an argument analogous to the previous one, we get $A \in \text{min}(\overline{\mathcal{A}})$. 

The lemma is proved.

**Theorem 4.2.** Let \( s = (U, F) \) be a relation scheme. Then
\[
\overline{Tr(K_s)} = \max(M_s).
\]

*Proof* According to Theorem 3.3 we have
\[
Tr(K_s) = \min(M_s).
\]
From this and Lemma 4.1, we obtain
\[
\overline{Tr(K_s)} = \max(M_s).
\]
The theorem is proved.

The Theorem 4.2 means that
\[
\forall X^+ \subseteq U, \exists A \in \overline{Tr(K_s)} : X^+ \subseteq A.
\]
Note that the following result is known [4].

**Proposition 4.3.** Let \( s = (U, F) \) be a relation scheme. Then
\[
K_s^{-1} = \overline{Tr(K_s)}.
\]

Therefore, by Theorem 4.2 and Proposition 4.3, the following corollary is evident.

**Corollary 4.4.** Let \( s = (U, F) \) be a relation scheme. Then
\[
K_s^{-1} = \max(M_s).
\]

5. CONCLUSION

We have characterized the set of all minimal keys of relation schemes in terms of hypergraphs. Furthermore, the set of antikeys is also studied in this paper. We present connections between the set of antikeys and the set of closures of relation schemes.
