#### Abstract

Eight compounds, diketopiperazine dimer WIN 64821 (1), ergosterol peroxide (2), ergosterol (3), $3 \beta, 5 \alpha, 9 \alpha-$ trihydroxyergosta-7,22-dien-6-one (4), 3,4-dihydroxy-6,7-dimethyl-quinolin-2-carboxylic (5), norhaman (6), dihydrocitrinin (7), and phenol A acid (8) were isolated and characterized from the culture broth of the marine-derived Penicillium sp. OM07 strain was isolated from sediment collecting at Son Cha, Hue, Vietnam. Their structures were determined by analyses of MS and NMR data. All compounds were evaluated for their antimicrobial activity against a panel of clinically significant microorganisms. Most showed high antifungal activity against Candida albicans ATCC10231 strain with MIC values ranging from $8 \mu \mathrm{~g} / \mathrm{mL}$ to $256 \mu \mathrm{~g} / \mathrm{mL}$. All compounds had inhibitory activity against from one to three Gram-positive tested strains with MIC values from $64-256 \mu \mathrm{~g} / \mathrm{mL}$.

Keywords: Penicillium, diketopiperazine dimer, antimicrobial activity, ergosterol, marine sediment.

[^0]
## INTRODUCTION

Marine-derived fungi from the Penicillium genus have received remarkable interest as a valuable source of novel natural products with potential applications in industry, agriculture, and medicine [1]. Marine Penicillium fungi have been found in sediments, mangroves, sponges, and algae and have been shown to have high novelty for more than 390 new metabolites in the last decade, including alkaloids, polyketides, terpenes, steroids, and macrolides [2] that possess important biological activities such as antimicrobial, anticancer, anti-inflammatory and larvicidal [3, 4]. In Vietnam, few publications have been on the chemical constituents of the marine fungi Penicillium $[5,6]$.

During our screening program, the extract of the Penicillium sp. OM07 strain exhibited antimicrobial activity against three Grampositive bacteria strains: Staphylococus aureus ATCC25923, Enterococcus faecalis ATCC29212, and Bacillus cereus ATCC14579 with MIC values of 256,128 and $64 \mu \mathrm{~g} / \mathrm{mL}$, respectively. Further investigation on the chemical constituents resulted in the identification of eight compounds (1-8) from the fungus Penicillium sp. OM07 strain isolated from sediment samples collected at Son Cha (Hue, Vietnam).

## MATERIALS AND METHODS

## Collection of marine sediment sample

The marine sediment sample (Name of sample: 243 A) was collected in the Son Cha Hue sea area, Vietnam, in May 2021. It was collected at 34.2 m depth, with a geographic coordinate of $16.4^{\circ} 45^{\prime} 28^{\prime \prime}-108.0^{\circ} 88^{\prime} 13^{\prime \prime}$ and a water temperature of $28^{\circ} \mathrm{C}$. The sample was collected into a 50 mL sterile Falcon tube, preserved on ice, and processed within 24 hours.

## Isolation and identification of the fungus OM07

The sediment sample was homogenized and treated using a wet-heat technique at $60^{\circ} \mathrm{C}$ for 6 min . A ten-fold dilution series diluted the suspension to $10^{-3}$. Then, aliquots of $50 \mu \mathrm{~L}$ were
spread on Petri dishes PDA solid medium ( $30 \mathrm{~g} / \mathrm{L}$ potato extract, $20 \mathrm{~g} / \mathrm{L}$ dextrose, $5 \mathrm{~g} / \mathrm{L}$ soluble starch, $30 \mathrm{~g} / \mathrm{L}$ instant ocean, $15 \mathrm{~g} / \mathrm{L}$ agar). The plates were incubated at $28^{\circ} \mathrm{C}$ for 7 days. The colony of fungus OM07 was transferred onto a new Petri dish of medium PDA for purification (Figure 1).

Figure 1. Morphological appearance of OM07 strain's colonies

The taxonomy of the strain OM07 was identified by using 18 S rRNA gene sequence analysis and compared with fungal 18 S rRNA sequences in the GenBank database by the NCBI Blast program. The results showed that strain M893 belonged to the genus Penicillium.

## Fermentation fungus OM07

The strain OM07 was activated and inoculated into 1 L of PDB broth medium pH 7.0 (comprising $30 \mathrm{~g} / \mathrm{L}$ potato extract, $20 \mathrm{~g} / \mathrm{L}$ dextrose, $5 \mathrm{~g} / \mathrm{L}$ soluble starch, $30 \mathrm{~g} / \mathrm{L}$ instant ocean). After 7 days of incubation at $28^{\circ} \mathrm{C}$ with shaking of 100 rpm , the culture broth was spread on the medium surface of 50 flasks (each 3L flask containing 1 L of PDA medium, pH 7.0). The flasks were incubated at $28^{\circ} \mathrm{C}$ and harvested for twenty-five days.

## General Experiment procedures

Melting points were recorded on a Buchi B545 instrument. Optical rotations were
recorded on an Atago Polax-2L polarimeter, using a sodium (589, D line) lamp. HR-ESI-MS spectra were obtained using an AGILENT 6550 iFunnel Q-TOF LC/MS system. ESI-MS was performed on an Agilent 6120 instrument, and CD spectra were recorded on a Chirascan CD spectrometer. Using TMS as the internal standard, 1D and 2D NMR spectra were recorded on Bruker Avance 500 MHz and 600 MHz spectrometers. Column chromatography (CC) was performed with silica gel (230-400 mesh, Merck). Thin layer chromatography monitored the fractions; spots were visualized by UV light ( 254 and 365 nm ) and by heating silica gel plates sprayed with Cerium (IV)sulfate reagent. All column chromatography solvents were distilled before being used.

## Extraction and isolation

The fermentation products of strain Penicillium sp. OM07 were cut into small pieces and sonicated in ethyl acetate (three times $\times 2$ hours each) at $40^{\circ} \mathrm{C}$. The combined ethyl acetate extracts were concentrated under reduced pressure to give 50.0 g of ethyl acetate (EtOAc) extract. The EtOAc extract was separated on a silica gel column chromatography (CC) and eluted with a solvent gradient $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ ( $5 \%$ to $100 \% \mathrm{MeOH}$ ) to yield 9 fractions F1-F9. Fraction $3(0.8 \mathrm{~g})$ was separated on a Sephadex LH-20 CC and eluted with MeOH to obtain five fractions F3.1-F3.5. Fraction $3.3(0.18 \mathrm{~g})$ was separated on a silica gel CC eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ /acetone (95/5) to obtain $3(5 \mathrm{mg})$. Fraction $5(3.2 \mathrm{~g})$ was separated on a Sephadex LH-20 CC eluted with MeOH to obtain five fractions F5.1-F5.5. Fraction F5.3 (0.16 g) was continuously separated by silica gel column chromatography and eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ /acetone gradient ( $5 \%$ to $100 \%$ acetone) to give five fractions F5.3.1F5.3.5. Fraction 5.3.4 was crystallized with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ /acetone ( $9 / 1, \mathrm{~V} / \mathrm{V}$ ) to yield 5 ( 4 mg ). Fraction F6 ( 2.8 g ) was further purified by gel filtration over Sephadex LH-20 CC with MeOH as eluent to give 5 fractions F6.1-F6.5. Fraction F6.2 ( 0.2 g ) was continuously separated by silica gel CC , eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ gradient
to give $2(5 \mathrm{mg})$ and $4(4 \mathrm{mg})$. Fraction F7 $(2.2 \mathrm{~g})$ was separated by silica gel CC , eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ gradient (5\% to $100 \%$ MeOH ) to give 6 fractions F7.1-F7.6, fraction F7.3 ( 0.3 g ) was continuously separated by Sephadex LH-20 CC to give 4 fractions F7.3.1F7.3.4, fraction 7.3.2 was crystallized to yield 1 ( 6 mg ). Similarly, fraction F7.4 ( 0.42 g ) was separated on a silica gel CC, eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ /acetone $(9 / 1)$ to yield 6 . Fraction F 8 $(3.5 \mathrm{~g})$ was further purified by gel filtration over Sephadex LH-20 CC, eluted with MeOH to give 7 fractions F8.1-F8.7. Fraction 8.3 ( 0.25 g ) was continuously subjected by silica gel CC , eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ gradient (5\% to $100 \%$ MeOH ) to yield 7 ( 5 mg ), and 8 ( 4 mg ).

Dihydrocitrinin (7): colorless solid, ESI-MS $\mathrm{m} / \mathrm{z}$ $253[\mathrm{M}+\mathrm{H}]^{+},{ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}-\mathrm{d}_{4}\right) \delta_{\mathrm{H}}$ (ppm): $1.23\left(3 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.5 \mathrm{~Hz}, \mathrm{CH}_{3}-9\right), 1.24(3 \mathrm{H}, \mathrm{d}$, $\left.J=6.5 \mathrm{~Hz}, \mathrm{CH}_{3}-10\right)$, $2.05\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}-11\right)$, $2.68(1 \mathrm{H}$, $\mathrm{dq}, J=2.5,6.5 \mathrm{~Hz}, \mathrm{H}-4), 3.92(1 \mathrm{H}, \mathrm{dq}, J=2.5$, $6.5 \mathrm{~Hz}, \mathrm{H}-3), 4.59(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=15.0 \mathrm{~Hz}, \mathrm{H}-1 \mathrm{~b}), 4.66$ $(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=15.0 \mathrm{~Hz}, \mathrm{H}-1 \mathrm{a}) .{ }^{13} \mathrm{C} \operatorname{NMR}(125 \mathrm{MHz}$, $\left.\mathrm{CD}_{3} \mathrm{OD}-d_{4}\right), \delta_{\mathrm{C}}(\mathrm{ppm}): 10.0\left(\mathrm{CH}_{3}, \mathrm{C}-11\right), 18.2\left(\mathrm{CH}_{3}\right.$, $\mathrm{C}-9), 20.6\left(\mathrm{CHC}_{-3}, 10\right), 36.8(\mathrm{CH}, \mathrm{C}-4), 60.2\left(\mathrm{CH}_{2}\right.$, $\mathrm{C}-1), 75.6(\mathrm{CH}, \mathrm{C}-3), 101.5(\mathrm{C}, \mathrm{C}-7), 110.7(\mathrm{C}$, C-8a), 112.8 (C, C-5), 142.7 (C, C-4a), 156.2 (C, C-8), 159.2 (C, C-6), 169.8 (C=O, C-12).

Phenol A acid (8): white solid, $[\alpha]_{D}{ }^{25}=-45^{\circ}$ (c. $0.1, \mathrm{MeOH}),{ }^{1} \mathrm{H}-\mathrm{NMR}\left(600 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}-d_{4}\right)$ $\delta_{\mathrm{H}}(\mathrm{ppm}): 1.16\left(3 \mathrm{H}, \mathrm{d}, J=7.2 \mathrm{~Hz}, \mathrm{CH}_{3}-3^{\prime}\right), 1.18$ $\left(3 \mathrm{H}, \mathrm{d}, J=6.0 \mathrm{~Hz}, \mathrm{CH}_{3}-4^{\prime}\right), 2.11\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}-7\right)$, $3.09\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-1^{\prime}\right), 3.90\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-2^{\prime}\right), 6.26(1 \mathrm{H}$, $\mathrm{s}, \mathrm{H}-5) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(150 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}-d_{4}\right): \delta_{\mathrm{C}}(\mathrm{ppm})$ $10.6\left(\mathrm{CH}_{3}-7\right), 16.3\left(\mathrm{CH}_{3}, \mathrm{C}-4^{\prime}\right), 19.6\left(\mathrm{CH}_{3}, \mathrm{C}-3^{\prime}\right)$, $43.4\left(\mathrm{CH}, \mathrm{C}-1\right.$ '), 71.9 ( $\mathrm{CH}, \mathrm{C}-2^{\prime}$ ), $102.8(\mathrm{C}, \mathrm{C}-1)$, 104.5 (C, C-5), 113.9 (CH, C-3), 149.1 (C, C-4), 160.3 (C, C-6), 160.8 (C, C-2), 173.0 (C, C=O).

Evaluating antimicrobial activity of the OMO7 strain

Antimicrobial activity test using the serial dilution method of Andrews (2001) [7] was
carried out at the Institute of Marine Biochemistry, Vietnam Academy of Science and Technology. The samples were diluted in DMSO in the decreasing concentration range of 256 , $128,64,32,16,8,4$, and $2 \mu \mathrm{~g} / \mathrm{mL}$. Next, $50 \mu \mathrm{~L}$ of bacteria and yeast solution at a concentration of $2.10^{5} \mathrm{CFU} / \mathrm{mL}$ were added and the mixture was incubated at $37^{\circ} \mathrm{C}$ for 24 hours. The MIC value was determined at the sample with the lowest concentration which was able to inhibit the growth of microorganisms after 24 hours completely. Streptomycin and nystatin antibiotics were positive controls for bacteria and yeast, respectively. Seven tested strains used in this study were provided by the American Type Culture Collection (ATCC), including three Gram-negative strains: Escherichia coli ATCC25922, Pseudomonas aeruginosa ATCC27853, Salmonella enterica ATCC13076,
three Gram-positive strains: Enterococcus faecalis ATCC29212, Staphylococus aureus ATCC25923, Bacillus cereus ATCC 14579 and one yeast strain Candida albicans ATCC10231. The independent experiments were performed in triplicate.

## RESULTS AND DISCUSSION

From the fermentation broth of the Penicillium sp. OM07 strain, eight compounds, diketopiperazine dimer WIN 64821 (1), ergosterol peroxide (2), ergosterol (3), $3 \beta, 5 \alpha, 9 \alpha$-trihydroxyergosta-7,22-dien-6-one
(4), 3,4-dihydroxy-6,7-dimethyl-quinolin-2carboxylic (5), norharman (6), dihydrocitrinin (7), and phenol A acid (8) were isolated. Their structures were determined by spectral data analysis, including MS and 2D-NMR.

Figure 2. Secondary metabolites 1-8 from Penicillium sp. OM07

Compound 1 was isolated as an optically active white solid $[\alpha]_{D}{ }^{25}+225.2^{\circ}$ (c 1.73, MeOH ). Its positive HR-ESI MS showed a pseudo-molecular ion $[\mathrm{M}+\mathrm{H}]^{+}$at $\mathrm{m} / \mathrm{z} 665.2891$ (calcd. 665.2871 for $\left[\mathrm{C}_{40} \mathrm{H}_{37} \mathrm{~N}_{6} \mathrm{O}_{4}\right]^{+}$), leading to the molecular formula of $\mathrm{C}_{40} \mathrm{H}_{36} \mathrm{~N}_{6} \mathrm{O}_{4}$. However, analysis of the ${ }^{13} \mathrm{C}$-NMR and DEPT with the aid of HSQC spectra revealed the presence of only twenty carbon signals, including two carbonyl groups at $\delta_{c} 167.4,168.5$, two $s p^{3}$ methylene groups, three $s p^{3}$ methine groups, nine $s p^{2}$
methine groups and four non-protonated carbons. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of 1 showed signals of four aromatic protons at $\delta_{\mathrm{H}} 6.69(1 \mathrm{H}$, $\mathrm{d}, J=7.8 \mathrm{~Hz}, \mathrm{H}-7), 6.81(1 \mathrm{H}, \mathrm{dt}, J=0.6,7.8 \mathrm{~Hz}$, $\mathrm{H}-5), 7.19(1 \mathrm{H}, \mathrm{dt}, \mathrm{J}=0.6,7.8 \mathrm{~Hz}, \mathrm{H}-6), 7.34$ $(1 \mathrm{H}, \mathrm{d}, J=7.8 \mathrm{~Hz}, \mathrm{H}-4)$, characteristic of a 1,2-disubstituted benzene ring, and five aromatic protons at $\delta_{\mathrm{H}} 7.09(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.8 \mathrm{~Hz}$, $\mathrm{H}-19, \mathrm{H}-23), 7.22(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.8 \mathrm{~Hz}, \mathrm{H}-20, \mathrm{H}-22)$, $7.23(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-21)$, characteristic of a monosubstituted benzene ring. Signals of seven
protons in the aliphatic region were also noted. This observation suggested a dimeric structure for compound 1. The chemical shifts of CH-14/CH-14' ( $\delta_{\mathrm{C}} 56.4, \delta_{\mathrm{H}} 4.06$ ), $\mathrm{CH}-11 / \mathrm{CH}-11^{\prime}$ ( $\delta_{\mathrm{C}} 57.1, \delta_{\mathrm{H}} 3.95$ ), and $\mathrm{CH}-2 / \mathrm{CH}-2^{\prime}\left(\delta_{\mathrm{C}} 79.8, \delta_{\mathrm{H}}\right.$ 4.94) suggested their linkage to nitrogen. Phenylalanine and tryptophan-derived subunits were readily identified after analysis of $\operatorname{COSY}$, HSQC, and HMBC NMR data (Fig 3). In the ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY spectrum of 1 , four spin-spin interaction systems of the proton: H-4 ( $\delta_{\mathrm{H}} 7.34$ )/H-5 $\left(\delta_{\mathrm{H}} 6.81\right) / \mathrm{H}-6\left(\delta_{\mathrm{H}} 7.19\right) / \mathrm{H}-7$ ( $\delta_{\mathrm{H}} 6.69$ ); H-10 $\left(\delta_{H} \quad 2.76,3.16\right) / \mathrm{H}-11 \quad\left(\delta_{\mathrm{H}} 3 \quad .95\right) ; \quad \mathrm{H}-14$ $\left(\delta_{H} 4.06\right) / \mathrm{H}-17$ ( $\delta_{H} 2.66,3.45$ ), and $\mathrm{H}-19$ $\left(\delta_{H} 7.09\right) / \mathrm{H}-20\left(\delta_{H} 7.22\right) / \mathrm{H}-21\left(\delta_{H} 7.23\right) / \mathrm{H}-22$ $\left(\delta_{H} 7.22\right) / \mathrm{H}-23\left(\delta_{H} 7.09\right)$ were indicated by the presence of four fragments shown in Figure 3. In the $H M B C$ spectrum of 1 , correlations between the proton of NH-15 ( $\delta_{\mathrm{H}} 5.61$ ) with $\mathrm{C}-13\left(\delta_{\mathrm{c}} 167.4\right), \mathrm{C}-16\left(\delta_{\mathrm{C}} 168.5\right), \mathrm{C}-14\left(\delta_{\mathrm{C}} 56.4\right)$, $\mathrm{C}-11\left(\delta_{C} 57.1\right)$ and $\mathrm{C}-17\left(\delta_{\mathrm{C}} 36.6\right)$ indicated the presence of a diketopiperazine ring system. In the NOESY spectrum, the NOE cross-peaks between $\mathrm{H}-14$ and $\mathrm{H}-2, \mathrm{H}-11$, and $\mathrm{H}-2$ suggested that $\mathrm{H}-2, \mathrm{H}-11$, and $\mathrm{H}-14$ were oriented on the same side. Analyses of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR, HSQC, HMBC, COSY, and NOESY spectra of 1 indicated a diketoperazine dimer skeleton similar to that found in Aspergillus flavus [8]. The planar structure of 1 was established, as shown in Figure 2. The relative configuration of 1 was determined by NOESY spectra and in comparation of ${ }^{13} \mathrm{C}$-NMR chemical shifts, coupling constant in the ${ }^{1} \mathrm{H}$-NMR spectrum and optical rotation value with those for several known diketoperazine dimer, including WIN $64821\left[[\alpha]_{0}^{25}+200.0^{\circ}\right.$ (c 0.15, MeOH), $[\alpha]_{0}^{26}+350.0^{\circ}$ (c 0.20, MeOH)] [9], ent-WIN $64821[\alpha]^{25}-200^{\circ}(c=0.07$, MeOH ) [9], and the other asymmetric analogs $\left[[\alpha]_{\mathrm{D}}{ }^{21}-292\left(c=0.97, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right),[\alpha]_{\mathrm{D}}{ }^{24}-330(c=\right.$ $\left.\left.0.52, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)\right] \quad[10], \quad[\alpha]_{0}^{26}-321.4^{\circ}$ (c 0.15 , pyridine), $[\alpha]_{0}{ }^{27}-377^{\circ}$ (c 0.68 , MeOH), $[\alpha]_{D}{ }^{25}$ $-114^{\circ}$ (c 0.24, pyridine) [10]. Compound 1 was thus identified as a diketopiperazine dimer WIN 64821 [ $9,11,12$ ].

Compound 2 was obtained as white amorphous solid and optically active $[\alpha]_{0}{ }^{25}=$ $-43.1^{\circ}$ (c $0.05, \mathrm{CHCl}_{3}$ ). The ESI-MS spectrum indicated the pseudo-molecular ion peak at
$\mathrm{m} / \mathrm{z} 429.7[\mathrm{M}+\mathrm{H}]^{+}$. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of 2 showed the presence of two singlet methyls at $\delta_{\mathrm{H}} 0.83\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}-18\right), 0.88\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}-19\right)$, four doublet methyls at $\delta_{H} 0.82(3 \mathrm{H}, \mathrm{d}, \mathrm{J}=$ $\left.6.6 \mathrm{~Hz}, \mathrm{CH}_{3}-27\right), 0.84\left(3 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.6 \mathrm{~Hz}, \mathrm{CH}_{3}-26\right)$, $0.91\left(3 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.6 \mathrm{~Hz}, \mathrm{CH}_{3}-28\right), 1.00(3 \mathrm{H}, \mathrm{d}, \mathrm{J}=$ $6.6 \mathrm{~Hz}, \mathrm{CH}_{3}-21$ ), four $s p^{2}$ methines at $\delta_{\mathrm{H}} 5.14$ ( $1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=8.4,15.6 \mathrm{~Hz}, \mathrm{H}-22$ ), $5.22(1 \mathrm{H}, \mathrm{dd}, J=$ $7.8,15.6 \mathrm{~Hz}, \mathrm{H}-23), 6.24(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.4 \mathrm{~Hz}, \mathrm{H}-6)$, $6.50(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.4 \mathrm{~Hz}, \mathrm{H}-7)$ and one methine bearing oxygen at $\delta_{H} 3.97(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-3)$. The ${ }^{13} \mathrm{C}$-NMR and DEPT spectra of 2 exhibited the presence of 28 carbons, including six methyl groups, seven methylene groups, seven $s p^{3}$ methine groups, four $s p^{2}$ methine groups, one oxymethine at $\delta_{C} 66.5$ ( $\mathrm{C}-3$ ) and four quaternary $s p^{3}$ carbons. The coupling constants of two olefinic protons $\mathrm{H}-22, \mathrm{H}-23$ were 15.6 Hz suggested $E$ configuration of double bond. The configuration of C-24 was suggested to be $R$ based on the ${ }^{13} \mathrm{C}-\mathrm{NMR}$ chemical shift of $\mathrm{C}-28$ ( $\delta_{c}$ 17.6). It was reported that the ${ }^{13} \mathrm{C}$-NMR value of $\mathrm{C}-28$ resonates at $\delta_{\mathrm{C}} 17.6$ in the $24 R$ epimer of known sterol, and the 24 S epimer has a relative 0.4 ppm downfield chemical shift [13]. Thus, analysis of the NMR spectra and comparison with reported data, compound 2 was identified as ergosterol peroxide [14].

Compound 3 was isolated as a colorless needle and optically active $[\alpha]_{D}{ }^{25}=-101^{\circ}$ (c 0.05 , $\mathrm{CHCl}_{3}$ ). The 1D-NMR of 3 showed the typical signals of ergosterol as compound 2 , with the presence of 28 carbons, including two tertmethyl groups at $\delta_{\mathrm{C}} 12.1$ (C-18), 16.3 (C-19), and four sec-methyl groups at $\delta_{C} 17.6$ (C-28), 19.6 (C-26), 19.9 (C-27), 21.1 (C-21). In addition, the signals of one oxymethine $\left[\delta_{c} 70.5\right.$ $\left.(\mathrm{C}-3) / \delta_{H} 3.63(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-3)\right]$, four $s p^{2}$ methines of two double bonds $\left[\delta_{H} 5.23(1 \mathrm{H}, \mathrm{dd}, J=7.8\right.$, $15.0 \mathrm{~Hz}, \mathrm{H}-23) / \delta_{\mathrm{C}} 132.0(\mathrm{C}-23), 5.17$ (1H, dd, $\mathrm{J}=$ $6.6,15.0 \mathrm{~Hz}, \mathrm{H}-22) / \delta_{\mathrm{C}} 135.6(\mathrm{C}-22), 5.38(1 \mathrm{H}$, $\mathrm{m}, \mathrm{H}-7$ )/ $\delta_{\mathrm{c}} 116.3$ (C-7); 5.57 ( $1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=2.4,5.4$ $\mathrm{Hz}, \mathrm{H}-6$ )/119.6 (C-6) were also observed. The coupling constant of two olefinic protons, $\mathrm{H}-22$ and $\mathrm{H}-23$, was 15.0 Hz suggested $E$ configuration of double bond. Thus, through analysis of the NMR spectra and comparison with reported data, compound 3 was identified as ergosterol [14].

Comparison of the 1D-NMR signal of 4 with those of 3 depicted the presence of the carbonyl group at $\delta_{C} 197.6$ (C-6), two oxygenated quaternary $s p^{3}$ carbons and the absence of one double bond (one $s p^{2}$ methine group and one quaternary $s p^{2}$ carbon) and one $s p^{3}$ methine. Analysis of the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of 4 revealed signals of three olefinic protons at $\delta_{\mathrm{H}} 5.17(1 \mathrm{H}, \mathrm{dd}, J=7.8,15.0 \mathrm{~Hz}, \mathrm{H}-22), 5.25$ ( $1 \mathrm{H}, \mathrm{dd}, J=7.8,15.0 \mathrm{~Hz}, \mathrm{H}-23$ ) and $5.67(1 \mathrm{H}, \mathrm{d}$, $J=1.8 \mathrm{~Hz}, \mathrm{H}-7)$. The signal of six methyl groups at $\delta_{\mathrm{H}} 0.62\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}-18\right), 0.82(3 \mathrm{H}, \mathrm{d}, \mathrm{J}=$ $\left.6.6 \mathrm{~Hz}, \mathrm{CH}_{3}-26\right), 0.83\left(3 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.6 \mathrm{~Hz}, \mathrm{CH}_{3}-27\right)$, $0.92\left(3 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.6 \mathrm{~Hz}, \mathrm{CH}_{3}-28\right), 1.03(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{3}-19\right), 1.04\left(3 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.6 \mathrm{~Hz}, \mathrm{CH}_{3}-21\right)$, one oxygenated methine proton at $\delta_{H} 4.06(1 \mathrm{H}, \mathrm{m}$, $\mathrm{H}-3$ ) and the protons of the aliphatic region at $\delta_{\mathrm{H}}$ 1.32-2.75 also observed on the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum. The ${ }^{13} \mathrm{C}-\mathrm{NMR}$ and DEPT spectrum of 4 showed the presence of twenty-eight carbons, including one carbonyl group ( $\delta_{C}$ 197.6), 6 methyl groups ( $\delta_{C} 12.3,17.6,19.6$, $19.96,20.5$ and 21.1 ), seven methylene groups, nine methine groups (three $s p^{2}$ methines at $\delta_{C} 119.9$ (C-7), 132.5 (C-23), 135.1 (C-22), one oxymethine group at $\delta_{C} 67.23$ (C-3)) and five non-protonated carbons. Analysis of 1D-NMR spectral data of compound 4 shows that this compound is an ergosterol. Comparing the 1D-NMR with reference data determined the structure 4 as $3 \beta, 5 \alpha, 9 \alpha$-trihydroxyergosta-7,22-dien-6-one. The substance was reported to inhibit the Hela cell line at a minimum concentration of $8 \mu \mathrm{~g} / \mathrm{mL}$ [15].

Compound 5 was isolated as a microcrystalline yellow solid. Its positive HR-ESI-MS showed the pseudo-molecular ion $[\mathrm{M}+\mathrm{H}]^{+}$at $\mathrm{m} / \mathrm{z} 234.0761$ (calcd 234.0766 for $\left[\mathrm{C}_{12} \mathrm{H}_{12} \mathrm{NO}_{4}\right]^{+}$), leading to the molecular formula of $\mathrm{C}_{12} \mathrm{H}_{11} \mathrm{NO}_{4}$. In the ${ }^{1} \mathrm{H}$ NMR spectrum, signals of two singlet aromatic protons at $\delta_{\mathrm{H}} 7.70(\mathrm{H}-8)$ and $7.91(\mathrm{H}-5)$, two singlet methyls at $\delta_{\mathrm{H}} 2.46$ $\left(\mathrm{CH}_{3}-10\right)$ and $2.49\left(\mathrm{CH}_{3}-11\right)$, and broad signal of hydroxyl proton at $\delta_{H} 11.65$ were observed. The ${ }^{13} \mathrm{C}-\mathrm{NMR}$ and DEPT spectra of 5 revealed the presence of a carboxylic carbon at $\delta_{C}$ 160.6, nine aromatic carbons, and two methyl carbons at $\delta_{C} 19.5$ and 20.2. In the HMBC spectrum of 5, the presence of the A-ring was established by cross-peaks of the proton of the $\mathrm{CH}_{3}-10$
group with $\mathrm{C}-5 / \mathrm{C}-6 / \mathrm{C}-7$; $\mathrm{CH}_{3}-11$ with $\mathrm{C}-6 / \mathrm{C}-7 / \mathrm{C}-$ 8 , and $\mathrm{H}-8$ with $\mathrm{C}-8 \mathrm{a}$ (Fig. 3). Additionally, the HMBC correlation between $\mathrm{H}-5$ with $\mathrm{C}-4 / \mathrm{C}-$ $4 a / C-8 a$ demonstrated the connection of $\mathrm{C}-4$ to $\mathrm{C}-4 \mathrm{a}$. The signals of two $s p^{2}$ quaternary carbons at $\delta_{C} 146.4$ and 150.0 and a carboxylic carbon at $\delta_{C} 160.6$ were remaining to be assigned. The carbon chemical shifts of C-2 ( $\delta_{\mathrm{C}} 150.0$ ), C-3 ( $\delta_{\mathrm{C}}$ 146.4), and $\mathrm{C}-4$ ( $\delta_{\mathrm{C}} 141.6$ ) suggested their linkages to nitrogen or oxygen atoms. However, all three carbons, C-2, C-3, and C-4, were observed downfield, and thus the carboxylic group's position could be assigned to be linked at C-2. Thus, the structure of compound 5 was identified as 3,4-dihydroxy-6,7-dimethyl-quinoline-2-carboxylic [16].

Compound 6 was isolated as a white solid, mp. $198-200^{\circ} \mathrm{C}$. The ESI-MS spectrum of 6 showed the protonated adduct $[\mathrm{M}+\mathrm{H}]^{+}$at $\mathrm{m} / \mathrm{z}$ 169. The ${ }^{1} \mathrm{H}$-NMR spectrum of 6 showed the signals of an 1,2-disubstituted benzene ring at $\delta_{H} 7.23(1 \mathrm{H}, \mathrm{td}, J=0.5 ; 8.0 \mathrm{~Hz}, \mathrm{H}-6), 7.55(1 \mathrm{H}$, $\mathrm{td}, J=1.0,8.0 \mathrm{~Hz}, \mathrm{H}-7), 7.60(1 \mathrm{H}, \mathrm{d}, J=8.0 \mathrm{~Hz}$, $\mathrm{H}-8), 8.22(1 \mathrm{H}, \mathrm{d}, J=8.0 \mathrm{~Hz}, \mathrm{H}-5)$, and three aromatic protons at $\delta_{\mathrm{H}} 8.09(1 \mathrm{H}, \mathrm{dd}, J=0.5$, $5.0 \mathrm{~Hz}, \mathrm{H}-3), 8.31(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=5.0 \mathrm{~Hz}, \mathrm{H}-4), 8.90$ $(1 \mathrm{H}, \mathrm{d}, J=0.5 \mathrm{~Hz}, \mathrm{H}-1)$. Analyses of the ${ }^{13} \mathrm{C}-\mathrm{NMR}$ and DEPT spectra with the HSQC of 6 indicated the presence of eleven carbons, including seven $s p^{2}$ methine carbons and four $s p^{2}$ quaternary carbons. Analysis of the COSY spectrum revealed the presence of two spinspin coupling systems: $\mathrm{H}-5 / \mathrm{H}-6 / \mathrm{H}-7 / \mathrm{H}-8$ and $\mathrm{H}-3 / \mathrm{H}-4$. In the HMBC spectrum, the interactions between $\mathrm{H}-1$ with $\mathrm{C}-8 \mathrm{~b}, \mathrm{C}-4 \mathrm{a}, \mathrm{C}-3$; $\mathrm{H}-3$ with $\mathrm{C}-1, \mathrm{C}-4 \mathrm{a}$; $\mathrm{H}-4$ with $\mathrm{C}-4 \mathrm{a}$ determined the positions of $\mathrm{C}-1, \mathrm{C}-4 \mathrm{a}$ and $\mathrm{C}-8 \mathrm{~b}$ (Fig 3). The positions of $\mathrm{C}-4 \mathrm{~b}$ and $\mathrm{C}-8 \mathrm{a}$ were confirmed through the interactions between $\mathrm{H}-6$ with C $4 b, H-5$ with $\mathrm{C}-4 \mathrm{~b}, \mathrm{C}-8 \mathrm{a}, \mathrm{H}-7$ with $\mathrm{C}-8 \mathrm{a}$, and $\mathrm{H}-8$ with C-4b, C-8a. Thus, detailed analysis of the 1D, 2D-NMR spectra, and MS data allowed for determining structure 6 as 9H-pyrido[3,4b]indole. Its NMR data were consistent with those reported in the literature $[17,18]$.

Compound 7 was isolated as a colorless solid. In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of 7 , the presence of three methyl signals, including one singlet at $\delta_{\mathrm{H}} 2.05\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}-11\right)$, and two doublets at $\delta_{\mathrm{H}} 1.23\left(3 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.5 \mathrm{~Hz}, \mathrm{CH}_{3}-9\right)$,
$1.24\left(3 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.5 \mathrm{~Hz}, \mathrm{CH}_{3}-10\right)$, one oxymethine proton at $\delta_{\mathrm{H}} 3.92(1 \mathrm{H}, \mathrm{dq}, J=2.5,6.5 \mathrm{~Hz}, \mathrm{H}-3)$, one methine proton at $\delta_{\mathrm{H}} 2.68(1 \mathrm{H}, \mathrm{dq}, \mathrm{J}=2.5$, $6.5 \mathrm{~Hz}, \mathrm{H}-4)$, one oxymethylene group at $\delta_{\mathrm{H}}$ $4.59(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=15.0 \mathrm{~Hz}, \mathrm{H}-1 \mathrm{~b}), 4.66(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=$ $15.0 \mathrm{~Hz}, \mathrm{H}-1 \mathrm{a})$ were observed. The ${ }^{13} \mathrm{C}-\mathrm{NMR}$ and DEPT spectrum of 7 showed the presence of 13 carbons, including one carbonyl group ( $\delta_{c}$ 169.8), 3 methyl groups ( $\delta_{C} 10.0,18.2$ and 20.6), one methylene group ( $\delta_{C} 60.1$ ), one methine group ( $\delta_{C} 36.8$ ), one oxymethine group at $\delta_{C} 75.6$ and six non-protonated carbons. Comparing the 1D-NMR with reference data determined the structure of 7 as dihydrocitrinin [19].

Compound 8 was isolated as a white solid, $[\alpha]_{\mathrm{D}}{ }^{25}-45^{\circ}$ (c 0.1, MeOH). The ${ }^{13} \mathrm{C}-\mathrm{NMR}$ and DEPT spectra indicated the presence of 12 carbons, including one carbonyl group at
$\delta_{\mathrm{C}} 178.3(\mathrm{C}=0)$, three methyl groups at $\delta_{\mathrm{C}} 10.6$ $\left(\mathrm{CH}_{3}-7\right), 16.3\left(\mathrm{CH}_{3}-4^{\prime}\right), 19.6\left(\mathrm{CH}_{3}-3^{\prime}\right)$, one $s p^{2}$ methine group at $\delta_{C} 104.5(\mathrm{C}-5)$, one oxymethine group at $\delta_{C} 71.9\left(\mathrm{C}-2^{\prime}\right)$, one $s p^{3}$ methine group at $\delta_{C} 43.4\left(\mathrm{C}-1^{\prime}\right)$, and five quaternary $s p^{2}$ carbons. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of 8 is consistent with the ${ }^{13} \mathrm{C}-\mathrm{NMR}$ with the presence of one singlet aromatic proton at $\delta_{\mathrm{H}} 6.26(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-5)$, one oxymethine proton at $\delta_{\mathrm{H}} 3.90\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-2^{\prime}\right)$, one methine proton at $\delta_{\mathrm{H}} 3.09\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-1^{\prime}\right)$, three methyl signals including one singlet at $\delta_{\mathrm{H}} 2.11\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}-7\right)$, and two doublets at $\delta_{\mathrm{H}} 1.16(3 \mathrm{H}, \mathrm{d}, J=7.2 \mathrm{~Hz}$, $\left.\mathrm{CH}_{3}-3^{\prime}\right)$, $1.18\left(3 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.0 \mathrm{~Hz}, \mathrm{CH}_{3}-4^{\prime}\right)$ were observed. Comparing the 1D-NMR with reference data determined the structure of 8 as phenol $A$ acid $[6,20]$.

## Antimicrobial assay

Figure 3. Key HMBC, NOESY and COSY correlations of 1, 5 and 6
Table 1. Antibacterial and antifungal activities of compounds 1-8 (MIC: $\mu \mathrm{g} / \mathrm{mL}$ )

|  | Gram-positive |  |  | Gram-negative |  |  | Yeast |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Compd. | E. faecalis | S. aureus | B. cereus | E. coli | P. aeruginosa | S. enterica | C. albicans |
| 1 | 64 | 128 | $>256$ | $>256$ | $>256$ | $>256$ | 256 |
| 2 | 128 | 256 | $>256$ | $>256$ | $>256$ | 256 | 128 |
| 3 | 64 | 256 | 128 | $>256$ | $>256$ | $>256$ | 64 |
| 4 | 128 | 256 | $>256$ | $>256$ | $>256$ | $>256$ | 128 |
| 5 | 128 | 256 | 256 | 32 | 256 | 64 | $>256$ |
| 6 | $>256$ | 32 | $>256$ | $>256$ | $>256$ | $>256$ | $>256$ |
| 7 | 64 | 64 | 64 | $>256$ | $>256$ | $>256$ | 16 |
| 8 | 128 | 128 | 256 | $>256$ | $>256$ | $>256$ | 8 |
| Streptomycin | 256 | 256 | 128 | 32 | 256 | 128 | - |
| Nystatin | - | - | - | - | - | - | 8 |

All the isolates were evaluated for their (ATCC25922), Pseudomonas aeruginosa antibacterial activity against Escherichia coli (ATCC27853), Salmonella enterica (ATCC13076),

Enterococcus faecalis (ATCC299212), Staphylococcus aureus (ATCC25923) and Bacillus cereus (ATCC14579), and antifungal property against Candida albicans (ATCC10231) (Table 1). All the compounds inhibited effect on the growth of one to three Gram-positive strains with MIC values of $32-256 \mu \mathrm{~g} / \mathrm{mL}$. In particular, compound 5 showed antimicrobial activity against all three Gram-positive and three Gram-negative strains with MIC values from 32-256 $\mu \mathrm{g} / \mathrm{mL}$. Compounds 3, 7, and 8 inhibited all three Grampositive strains against antifungal C. albicans with MIC values from $8-256 \mu \mathrm{~g} / \mathrm{mL}$. In addition, compounds 1,2 , and 4 selectively inhibited two of three Gram-positive strains, E. faecalis, S. aureus, and C. albicans with a MIC value of 64$256 \mu \mathrm{~g} / \mathrm{mL}$. Compound 6 selectively inhibited S. aureus strain with a MIC value of $32 \mu \mathrm{~g} / \mathrm{mL}$.

## CONCLUSION

Analysis of an antimicrobial extract prepared from culture broth of the marinederived fungus Penicillium sp. OM07 led to the isolation of eight compounds identified as diketopiperazine dimer WIN 64821 (1), ergosterol peroxide (2), ergosterol (3), $3 \beta, 5 \alpha, 9 \alpha$-trihydroxyergosta-7,22-dien-6-one (4), 3,4-dihydroxy-6,7-dimethyl-quinolin-2carboxylic (5), norhaman (6), dihydrocitrinin (7), and phenol A acid (8). Most showed high antifungal activity against Candida albicans ATCC10231 strain with MIC values ranging from $8 \mu \mathrm{~g} / \mathrm{mL}$ to $256 \mu \mathrm{~g} / \mathrm{mL}$. All compounds had inhibitory activity against from one to three Gram-positive tested strains with MIC values in the $32-256 \mu \mathrm{~g} / \mathrm{mL}$ range.
