**ABSTRACT:** Most species of the longhorned beetles are known to damage living trees and attack dead trees or fallen logs and are of economic importance because their woodboring larvae are destructive to plants and freshly cut logs. The paper presented a checklist of publishing species of Vietnam longhorn beetle fauna of the subfamily Cerambycinae with local and world distribution provided. Of the total of 259 cerambycid species belonging to 88 genera and 18 tribes, seven diverse tribes are Clytini (74 species), Callichromini (41 species), Cerambycini (35 species), Molorchini (19 species), Callidiopini (18 species), Methiini (13 species) and Cleomenini (11 species).

**Keywords:** Coleoptera, Cerambycidae, Cerambycinae, checklist, distribution, Vietnam.

### INTRODUCTION

The Cerambycinae is a subfamily belonging to the family Cerambycidae, the largest family of Coleoptera. The cerambycids are commonly known as longhorned beetles, longicorns, capricorns, round-headed borers, timber beetles or goat beetles. The representatives of the family Cerambycidae have many varieties of shape, coloration and ornamentation as well as with the body size from 2.5 mm to 200 mm. The subfamily comprises about 20,000 species occur through almost every part of the world, i.e. from sea level to montane sites as high as 4,200 m elevation. Most species of the longhorned beetles are known to damage living trees and attack dead trees or fallen logs and are of economic importance because their woodboring larvae are destructive to plants and freshly cut logs [8].

Taxonomic interest in the family has been fairly consistent in the past century, however, taxonomic research on the longhorn beetles from Vietnam had been almost absent until recently. The first work of the longhorn beetles in Indochina (including Laos, Cambodia and Vietnam) was published by Fairmaire (1896) [16] and Vitalis de Salvaza (1919) [102], the later authors recorded 348 species from Vietnam. The result of the earliest survey carried out by the Ministry of Agriculture in the period 1967-1968 reported 127 species from

North Vietnam. Mai Phu Quy et al. (1981) [56] also recorded 52 species from the northern part of Vietnam. Recently, from 2005 to 2011, there were 169 the longhorn beetles were recorded from three provinces Quang Tri, Thua Thien-Hue and Quang Nam, 112 species recorded in the North of central Vietnam, 179 species recorded from four provinces Kon Tum, Gia Lai, Dak Lak and Dak Nong, 2005 (Hoang Vu Tru et al. 2005, 2006, 2009; Ta Huy Thinh et al. 2005) [33-35, 98]. The longhorn beetles of the subfamily Cerambycinae from Vietnam could also be found in several foreign authors as Holzschuh (1989, 1991, 1992, 1995, 1998, 1999, 2003, 2005, 2007, 2009, 2010) [36-46], Niisato (1996, 1998, 2000, 2002, 2004, 2006, 2009, 2011) [58-74], Hayashi (1976a, 1976b, 1981) [27-29], Heffern (2005, 2011) [30-32], Bentanachs et al. (2008) [7], Hua Li-zhong (2002, 2009) [48, 49]. But up to the present time, the taxonomy and systematics of the longhorned beetles of the subfamily Cerambycinae are studied poorly.

### MATERIALS AND METHODS

The specimens of the longhorn beetles were collected in several surveys organized by entomologists of Institute of Ecology and Biological Resources (IEBR). All the specimens are deposited in Department of Insect Systematics at IEBR.

The subfamily classification of this study

follows Gressitt & Rondon (1970) [25]. The original taxonomy documents in this study mainly refer to Aurivillius (1911, 1912) [2, 3], Bates (1873, 1879) [4, 5], Fabricius (1775) [14], Fairmaire (1895, 1896) [16, 17], Gahan (1906) [21], Pascoe (1856-1859, 1864-1869) [75-85], Lacordaire (1869) [52], Pic (1911, 1922, 1923, 1925, 1933) [86-92] and White (1853, 1855) [105, 106]. The distribution documents from Vietnam refer to the authors: Abang (2013) [1], Bentanachs (2005, 2008) [6, 7], Hayashi (1976a, 1976b, 1981) [27-29], Heffern (2005, 2007, 2011) [30-32]; Holzschuh (1998, 1991, 1992, 1995, 1998, 1999, 2003, 2005, 2007, 2009, 2010) [36-46], Hudepohl (1990) [50], Hua Li-zhong (2002, 2009) [48, 49], Niisato (1990, 1998, 2000, 20022, 2002b, 2004, 2006, 2009, 2011) [58-74], Vives & Bentanachs (2007) [103] and Vives & Mei-ying Lin (2013) [104].

Abbreviations of localities used in this paper are as follows: E: East; N: North; S: South; SW: Southwest; old name of localities used in the literature: Annam = North Central; Cochinchina = Southern Vietnam; SE: South East and Tonkin = Northern Vietnam.

## RESULTS AND DISCUSSION

This paper presents a list of 259 species in the systematic sequence of the following 18 tribes and 88 genera completing them with the number of the species recorded from Vietnam and in the parenthesis the number of the generic names. We included in the list for every species the page of first citing species for Vietnam, and the distribution of species in Vietnamese provinces shown in the parenthesis.

Cerambycinae là một trong các phân họ lớn thuộc họ Xén tóc Cerambicidae, sâu non của chúng sống trong thân cây đang còn sống hoặc cây đã chết khô, rất nhiều loài là những đối tượng gây hại cho cây trồng và cây rừng. Tổng số loài thuộc phân họ Cerambycinae đã biết trên thế giới ước tính tới 20.000 loài, chúng có mặt ở rất nhiều sinh cảnh từ gần bờ biển cho đến độ cao tới hơn 4.000 m.

Bài báo này lần đầu tiên đưa ra danh lục đầy đủ để tra cứu 259 loài xén tóc thuộc 88 giống và 18 tộc của phân họ Cerambicinae thuộc khu hệ xén tóc ở Việt Nam, đồng thời cung cấp những thông tin về phân bố của các loài ở Việt Nam và trên thế giới đã được các tác giả trong và ngoài nước thống kê cho đến thời điểm hiện nay.

Trong số 18 tộc, 7 tộc có số loài nhiều nhất gồm: Clytini với 74 loài, Callichromini: 41, Cerambycini: 35, Molorchini: 19, Callidiopini: 18, Methiini: 13 và Cleomenini: 11 loài; còn lại 11 tộc có số loài ít hơn 10 loài.
